Machine intelligence makes human morals more important (Zeynep Tufekci)

Now there are computer systems that can detect your emotional state and even lie when processing human expressions.

People have been using computers for a long time, but in the past, machines only performed tasks clearly defined by humans. Now there is machine learning, programs have become much more complex; computers are able to learn something on their own. And that's great from a developmental and perspective, but scary from the point of view that people don't know one hundred percent of what a computer system can learn.

Systems can be trained on the data of previous employees in order to hire the most effective employees in the future, similar to those who currently work in the company.

Now systems can learn everything about us: sexual orientation, character traits, political preferences, predisposition to depression. And even if we do not disclose some information about ourselves, the system will be able to make an assumption based on our social networks and search queries.

There is a problem that computer systems learn from human input. It turns out that machines learn human behavior. And we should not be fooled by the fact that computers remain objective.

It is also known that social media and search results have long been shaping our reality. It is they who now determine what we learn and what will remain a mystery to us.

But remember that computer systems can be wrong too. Sometimes these mistakes are ridiculous because a person would never have thought of such a mistake. But these mistakes often lead to huge problems.

We cannot avoid difficult issues, we cannot shift our responsibilities to machines, but we must not give up computers. They are great and really help us a lot. Artificial intelligence is already here. This means that we must continue to adhere to human values and ethics. Here are some important things to keep in

mind. We are people and we are great. So let's stay human, together we will become better and make the world around us a better place.
